

Northern Rockies Predictive Services

Daily Outlook - Sat Oct 15, 2005

Issued: 200 pm Friday Oct 14, 2005

Notice: This will be the last Daily product issued this year. The next one will be issued around the first of July, 2006 unless conditions warrant otherwise.

Synopsis: A trough of low pressure over the Pacific Northwest will bring isolated showers to northern Idaho and western Montana with near normal temperatures. Elsewhere conditions will be dry and mild. Winds will be gusty most areas. Similar conditions can be expected Sunday.

Temperatures will be in the mid 50s to mid 60s across northern Idaho, western Montana and North Dakota with mostly 60s to low 70s across eastern Montana. Humidity values will be 25-45% most areas with the lowest values across southern Montana. Winds will be west 10-20 mph across the western half of the Area and southeast 15-25 mph in the east.

Recent episodes of cool, wet weather have moderated Fire dangers, fuel moistures and ERC values to normal to below normal values for the larger fuels with minimal potential for wild fires.
